## INTFODUCTION

## OVERVIEW

EXTENDED FIG-FORTH fully implements the standard FORTH, as defined in the Forth Interest Group's (fig) Implementation Guide. It roughly follows the 6502 Rev, 1.1 FORTH sources as supplied by the Forth Interest Group (FORTH INTEREST GROUP, P.O. Box 1105, San Carios, CA 94070), Many changes were incorporated in adapting the sources to the ATARI Home Computer, but the definitions, operation, and user interfaces were implemented exactly as described in the Implementation Guide, Many additional definitions have been added, including extended double-precision words such as 2DUP, 2SWAP, DG, and D!. Further, the standard FORTH Editor, and a complete Assembler for the 6502 are included, as well as a set of ATARI Color/Graphic definitions, ATARI OS definitions, and a set of ATARI Floating-point definitions. One new definition, SAVE, (and CSAVE) allows a self-booting image of FORTH to be made on a diskette or cassette that will include new definitions you add; this feature allows application packages to be produced in volume. Definitions not implemented are DLIST, MON, and TASK. The complete set of ATARI Screen-Editor capabilities is implemented, making editing and changing FORTH programs simple and straightforward.

These instructions assume you are already familiar with FORTH. However, the manual does contain two bibliographies, one for works pertaining to FORTH and a more general one. There is also a two-page FORTH HANDY REFERENCE summary in the back.

If you're a beginning FORTH programmer, an excellent book to help you get started is Starting FORTH, by Leo Erodie, written at FORTH, Inc., and published by Prentice-Hall, FORTH Inc.'s "PolyForth" and fig-FORTH have some differences, However, EXTENDED fig-FORTH contains some screens that make it compatible with the FORTH used in the book. To use the book along with EXTENDED fig-FORTH, type in the command " 85 LOAD" to load the applicable screens into computer memory, and open the book!

## REQUIRED ACCESSORIES

Cassette version

## 16K RAM <br> ATARI 410 Program Recorder

(Note. FORTH as a computer language isn't very workable in a cassette-only environment, But applications software using FORTH can be put onto a self-booting cassette if desired.)

Diskette version
16K RAM
ATARI 10 Disk Drive
OPTIONAI ACCESSORIES

All ATARI peripherals and accessories
(Note, Extended fig-FORTH will work with any ATARI printer using two new definitions, PON , and POFF which turn the printer on and off. The printer does not print the prompts as they occur on the screen, allowing very clean printouts.)

## CONTACTING THE AUTHOR

Users wishing to contact the author about Extended fig-FORTH may write to him at:

or call him at:

## GETTING STARTED

## LOADING EXTENDED fig-FORTH INTO COMPUTER MEMORY

If you have the diskette version of EXTENDED fiq-FORTH:

1. Remove any cartridge from the cartridge slot of your computer.
2. Place the Extended fig-FORTH diskette in your disk drive and turn on the drive and the computer.
3. The program will load into memory and the prompt "fig-FORTH 1.1 " will display when the load is complete. Press the RETURN key to display the standard FORTH prompt " ok "*

4, The Editor, Assembler, Debug, QS, Color/Graphics, and Floating-point packages included with Extended fig-FORTH must be loaded in after booting-up the disk. Instructions for loading and using each package follow.
5. After loading in whichever packages you need (Note, You must load in the EDITOR--the command is 27 LOAD), you can make a new copy of FORTH that includes your loaded packages by inserting a formatted diskette into disk drive 1 and typing "SAVE", A self-booting copy will then be written to the new diskette.
6. Now replace the original diskette, type " 14 LIST MARK 15 LIST MARK " , and press the RETURN key, Two screens of error messages will be listed and saved internally.

7 Change diskettes once again and type " FLUSH " and the error messages will be written to your new diskette, You now have a clean diskette for your program development.
8. Store the original FORTH diskette in its folder and put it in a nice safe place, Note that you may make a complete copy of your original diskette using the DISKCOPY routine described later. This will copy the whole diskette, not just the FORTH and error messages.

## If you have the cassette version of EXTENDED fiq-FORTH:

1. Remove any cartridge from the slot of your computer.
$2+$ Turn off the computer and all other peripheral devices. Insert the cassette into the program recorder.
2. Hold down the START key on the computer and turn on the computer. The computer should beep.
3. Press the PLAY button on the program recorder.
4. Press the RETURN key on the computer and the cassette will load itself in. If the program successfully loads, you will see the prompt "fig-FORTH 1.1.
5. SEE THE CASSETTE NOTES AT THE END OF THIS SECTION.

## Editor and Assembler options

You have several options regarding the EDITOR and ASSEMBLER vocabularies: in addition to the standard EDITOR, a version of the FORTH Inc. Editor has been included, It may be loaded with a 69 IOAD command. Further, the Assembler written by Wm, Ragsdale is supplied (use the command 75 LOAD), which is identical to the assembler used in the Installation Guide.

16K RAM limitation
If you have only $16 K$ of RAM you will not be able to use some of the Color/Graphics higher-level graphics modes without interfering with the screen buffers.

## Cold starts with SYSTEM RESET key

The SYSTEM-RESET key calls the "COLD" (cold-start) function directly, so any new word definitions that have not been SAVEd will be erased. This can be a handy feature while debugging; press the SYSTEM RESET key to erase all your old work and leave a clean copy. There is a negative side: if your program wanders off into never-never land, and you have to press SYSTEM RESET, you'll lose all your new definitions unless you've been editing them into new screens. (Using the standard $O S$ screen-editing functions excludes the use of the BREAK key for this purpose. The BREAK key is used to inform the system to ignore the previous input string,)

FORTH and DOS incompatability
There is no compatability between FORTH diskettes and DOS (I or II) diskettes. You may read a DOS diskette with a FORTH program, but unless you know exactly what you're doing, writing to a DOS diskette will, in all probability, make the diskette unworkatle from a DOS point of view. The only DOS function applicable to FORTH is that FORTH expects DOS-formatted diskettes.

7-bit and e-bit output
The word TYPE outputs only 7 bits to the screen or printer. If you want TYPE to output all 8-bits (which includes inverse video characters), you can type in the following sequence:

```
HEX FF, TYFE 14 + C! DECIMAL
```

In fact, you can make up a couple of routines if you wish:

```
HEX
: MODTYFE , TYFE 14 + C! ;
: 8-EITS FF MODTYFE ;
: 7-ETTS 7F MODTYFE ;
DECIMAL
```

Then, to set your system to type out 7 bits, type 7 -BITS, and for e bits, type 8 -BITs.

Further, you can use these routines in any other programs you wish, just as you would any other word definition. If you type VLIST with TYPE set to 8-BITS then the last character of each word will be in inverse video. The word EMIT always outputs all 8 bits in each byte. TYPE uses EMIT with a mask for 7 or 8 bits.

## ERROR Screens

The ERROR screens are 13 and 14 instead of the standard 3 and 4 , This is because the self-booting FORTH interpreter, if it is present on the diskette you're using, occupies screens 0 through 7 , with 6 screens available for larger versions. If your working diskette doesn't have a bootable FORTH on it, you may use all screens numbered o through 89. Disk drive 2 screens are numbered 70 through 179. The second drive may also be accessed by the word DR1, which sets an offset into the drive addresses for automatically accessing the second drive. The word DRO accesses the first drive, Alternately, the blocks are numbered 0-719 on the first drive, and 720-1439 on the second drive.

## Disk Blocks

This is fig-FORTH, NOT FORTH-79! This means that disk blocks are 128 bytes long and not 1 K bytes long. Each screen is 8 blocks long, not 1 block long! A later version will be made available, someday, using the FORTH-79 standard, but Extended fig-FORTH uses the fig-FORTH standard.

## DEFINITIONS

## SAVE -

This word, when executed, saves a self-booting copy of the RAM-resident FORTH program to disk drive 1, after setting up new parameters for COLD and FENCE . On booting up, all definitions will be protected by FENCE, and the FORTH vocabulary will be the current dictonary, This word uses (SAVE) described later,

## CSAVE -

This word saves a self-booting copy of the RAM-resident FORTH program to the cassette recorder. The computer will beep twice, indicating that you are to press both the PLaY and the RECORD buttons on the recorder, followed by pressing the RETURN key on the computer.
(SAVE) $n^{-}$
This word writes $n$ blocks to disk drive 1, starting at sector 0 . This word should not be used by normal FORTH programs.
-DISK addr n2 n3 flag --- n4
This word performs the read/write on a disk, where addr is the starting RAM address, n 2 is the diskette sector number ( $0-719$ ), n3 is the drive number (1-4), and flag is 1 for a read, and 0 for a write, On return, $n 4$ will contain a zero if everything went all right, or it will contain the DOS error number returned by DOS if an error occurred. It is not expected that the normal FORTH program will use this word. The usual disk I/O word used is $R / W$, which is documented in the Implementation Guide.

ASCII -- c $\quad \rightarrow n$
This word places the binary value of character $c$ on the top of the stack,

## BEEP

This word sounds the "beep" tone on the computer's speaker.
BOOT
When executed, this word causes a cold-boot of the computer exactly as if the power were turned off.
(FMT) n1 --- n2

This word formats disk drive $n 1$ and returns the DOS status byte upon completion in n2 - This word is used by the word FORMAT in the OS definitions. No error checks are made and no warnings aregiven by this word. Those functions are performed by the FORMAT word. For more information, see the OS section in this manual.

This word allows the Screen Editor (E:) to handle the standard FORTH prompt properly. The interpreter can "eat" the previous "ok" prompt with no other effect. It allows you to repeat the same input stream by placing the cursor anywhere in a previous line and pressing the RETURN key,

PON

This word enables the printer. PFLAG is set to 1 , and thereafter every character put to the screen will be echoed on the printer except the prompts.

## POFF -

This word disables the printer. It sets PFLAG to zero.
PFLAG -- addr
This word is the printer-flag. See PON.
GFLAG - addr
This word is the graphics-mode, cursor-control flag. When GFLAG is set to non-zero, FORTH will use the alternate cursor-address variables required by the Operating System to handle the text-window at the bottom of the screen. This variable is handled automatically by the various graphic commands in the Color/Graphics package.

FROMPT --
This word was added to handle the extended complexities of excluding the prompt from the printer when FFLAG is non-zero. Basically it types "ok".

Words for using the Assembler
A series of words are defined for the ASSEMBLER:
NEXT
FUSH
FUT
FUSHOA
F'OF'
FOFPTWO
EINARY
IF'
W
N
XSAVE
UF'
Please refer to the ASSEMBLER documentation for their descriptions.

## NOTES

## THE CASSETTE VERSION

The cassette version of fig-FORTH contains the ASSEMBLER and DEBUG vocabularies already loaded. Because no diskette is used, the EDITOR vacabulary is essentially useless. However, printouts of the EDITOR, OS, and COLOR/GRAPHICS screens are included so that you may type them in if you wish. The cassette version is primarily for use as an introduction to the FORTH language, and not as a software development system. Nevertheless, the CSAVE feature allows you to develop permanent versions of your FORTH programs. See the following section for how to erase old definitions, Note that error messages in the cassette version type only a number. Refer to the printout of the error message screens for their meaning. The error numbers start sequentially at screen 14, line 1 (error 1).

## MODIFYING THE DICTIONARY

To erase a definition in your FORTH dictionary that is locked in (you get an "in protected dictionary" message when you try to FORGET a definition) do the following: using VIIST, find the name of the first word that you want to keep, call it XXX, and type ' XXX FENCE ! <RETURN>, This will set the dictionary protection to your XXX word. Then you may type FORGET name <RETURND, where "name" is the name of the word you wish deleted. Note that all words above "name" are deleted. You can actually instruct FORTH to forget everything, so be careful. If you make an error in a new definition that FORTH rejects for one reason or another, you may find that you cannot FORGET the new definition, and, in fact, only VLIST seems able to find it at all! In such cases, type the word SMUDGE and you'll be able to FORGET the word. By the way, you can interrupt VLIST anywhere you want by pressing any key except BREAK while it is typing out the dictionary.

[^0]
## INTRODUCTION

The ASSEMBLER vocabulary included in Extended fig-FORTH is a full-featured 6502 assembler, capable of assembling the range of assembler op-codes. It is similar to W. Ragsdale's assembler used in the fig Installation Manual. To load it, type:

39 LDAD
As is usual in any FORTH product, the notation used in this assembler is in Reverse Polish Notation (RPN). This brief outline assumes you know assembly language programming very well, particularly in regard to the 6502. The RPN notation will seem very awkward at first, but it allows the full power of FORTH to be brought to bear in an assembler-level routine. The op-codes are very similar to standard 6502 op-codes, except that every one ends with a comma, a FORTH convention for assembler-level codes, Some examples will help describe the assembler:

The current BASE value (radix) of FORTH determines whether the assembler creates hex, decimal, or octal values (or any radix, for that matter).

Non-standard op-codes are the A-register shifts only, which are expressed as:
FOL. A,
instead of the standard:
FOL A
and the op-code for an indirect JMP instruction, which is:
niririri JMF'(),
instead of:
JMF' (riririris).
Loop constructs use the words BEGIN, and END, (note the commas) and an alias for the latter UNTIL, . The END, is preceeded by a $0=$ or $0=$ NOT construct to determine loop termination. The termination test actually assembles as a BNE or BEQ instruction, as in the following example:

0 , $X$ LDY, EEGIN, INY, $0=$ END, NEXT JMF'

The above routine increments the $Y$-Register until it is zero and exits to a routine named NEXT. It will be assembled as:

LDY $0, X$
INY
ENE *-1
JMF NEXT

The Branch instructions have been integrated into a generalized IF construct so that they may be readily incorporated into an unlabeled branch capability. The syntax is:

$$
\text { IF } \lll+\cdots,++\quad \text { THEN, }
$$

or
IFツッ, $\cdots+\cdots+\ldots$ ENDIF,
where $x x$ is the last two letters of the standard 6502 branch instructions (IFEQ, IFNE, IFMI, etc.). The test will be made on the Status Register as appropriate to the sense of the conditional branch, and if the test is TRUE, the code enclosed between the IFxx, and the THEN, or ENDIF, will be executed; otherwise, the enclosed code will be skipped. The operation of the construct is almost identical to the IF ... THEN at the higher-level FORTH definitions, except that nothing is popped off the stack by the IFxx, words. Instead, a Branch instruction is assembled.

## LEGAL EXITS

There are only a few legal exits from assembly language FORTH routines to the main FORTH inner interpreter. These addresses are predefined in the main FORTH dictionary and need no further definition by the assembly language itself. These returns use a cecc JMP, sequence, as shown in later examples. The legal exits are:

NEXT

This is the normal return. It takes no stack action.

## PUT

This places the A-Register and the first item on the hardware stack on the top of the stack. That is, it does a 1 ,X STA, PLA, $0, X$ STA, NEXT JMP, sequence. This action overwrites whatever was previously on the top of the stack.

## PUSH

This pushes down the stack and does a PUT . This action adds one item to the stack.

POP
This performs the DROP function.

This performs DROP DROP.
PUSHOA
This first pushes the A-Register, followed by a zero. Essentially, it pushes one byte, the A-Register, onto the stack, adding a 16-bit word to the stack with the one byte in the lower half.

## gINARY

This word takes two words off the stack and replacea=s them with one word. The best example is the add word + . This routine does a DROP followed by a PUT, which overwrites the old top of the stack.

## CALLING THE ASSEMBLER

The word CODE is used to call the assembler automatically when defining a new assembly level routine. The charatter string following CODE will become a new FORTH word having directly executable assembly level code. Two examples follow that do the same thing--they multiply the top of the stack by two, using a single left shift across the two bytes that are the top of the stack:

The first routine shifts the actual memory locations of the top of the stack. This procedure is quite short and very fast. The second routine is the more universal method, in that the arguments are first loaded to the A-Register and later stored. Notice that the low order byte is pushed to the hardware stack and the high-order byte is left in the A-Register on the return to PUT. The second example shows how words are retrieved from the stack and how a return is made. To reach the second word down on the stack, you would use $2, \mathrm{X}$ LDA, to access the low byte and $3, \mathrm{X}$ LDA, to access the high byte, and so on. You can increment the stack pointer (push the stack) with a DEX, DEX, sequence, and pop the stack with an INX, INX, pair. In fact, the DROP word does a simple INX, INX, NEXT JMP, sequence.

If your routines need the $X$-Register for any reason, you must save it off someplace, A very convenient place called XSAVE is provided, Do a XSAVE STX, later followed by a XSAVE LDX, instruction.

Several other addresses are made available as "hooks" into the FORTH system. These are predefined words you use at your own risk (you'd better study up a bit before doing sol, but some routines, such as in the assembler itself, need these addresses.

This is the Intepreter Instruction Pointer, which points to the next word to be executed.

W
This is the actual execution address of the current word being executed.
N

This is a convenient eight-byte (4-word) save area where you may save your words and bytes by storing them in $\mathrm{N}+0, \mathrm{~N}+1, \mathrm{~N}+2 \ldots \mathrm{~N}+7$, You can use the following sequence to call an internal routine called SETUP, \# 2 LDA, SETUP JSR, if you want to copy the top two stack words into $N+0 \ldots \mathrm{~N}+3$, low bytes first. Use \# 3 for the top three stack words, and so on. This does not change the stack itself; it only extracts copies of however many words you want.

On entry to your routine, the $Y$-Register will contain a zero. This fact can be handy for clearing out bytes or registers. For example, you can clear the A-Register with a simple TAY, instruction.

Using the assembler, like in almost any assembly level programming, is playing with fire, and you'll probably get burned from time to time. But, one of the delights of FORTH is that you can simply re-boot and try again. Careful examination of your code will probably clear up your problems.

Note, A good descripton of Wm. Ragsdale's assembler is in Dr. Dobb's Journal, Vol. 6. No. 9 (Sept. '81). This assembler is quite similar on the surface. Internally, they are totally different approaches to solving the same problem using FORTH, Reading Ragsdale's code and reading the code for this assembler could be very instructive in the area of assembly level FORTH programming.

## INTRODUCTION

You must have already loaded the ASSEMBLER Vocabulary into your FORTH dictionary before the COLOR/GRAPFICS definitions will LOAD properly. Once you have the ASSEMBLER loaded, type:

50 LOAD
and/or
56 LOAD --s for the SOUND commands
A small demo program will draw a box and FIL it in Graphics Mode 5 when you enter the word FBOX . Type:

57 LOAD FEOX

Type 57 LIST to examine the program itself.
NOTE. As in BASIC, a color value of zero is used to erase a point. Also, note that in Graphics Mode 8 , there are only two color values: zero or one.

## DEFINITIONS

The following words have been defined for use with Extended fig-FORTH in programming color graphics. Most resemble the commands used in ATARI BASIC.

SETCOLOR n1 n2 n3 ---
Color register $n 1(0.4)$ is set to color $n 2(0 . .15)$ at luminance $n 3(0.4)$, This word is very similar to ATARI BASIC's SETCOLOR command.

SE. n1 n2 n 3 -
This is a synonym for SETCOLOR using an the abbreviation used in ATARI BASIC.
GR. $\mathrm{n}^{---}$
This word selects Graphics Mode $n$ where $n$ is defined as in ATARI BASIC's "GRAPHICS n" command. (plus modes 9, 10, and 11).

XGR ---
This word allows easy exit from Graphics Modes 1-8. It essentially does a " O GR ",
POS n1 n2 ---
This word sets the $X(n 1)$ and $Y(n 2)$ coordinates for the next point to be plotted. It does not plot anything by itself. It is primarily used in the FIL word definition.

PLOT $n 1 n 2 n 3-$
This word uses the color value given by $n 1$ to plot the point at position $X(n 2)$, $Y$ ( n 3 ).

DRAW n1 n2 n3 ---
This word draws a line from the last plotted point, using color value $n 1$ to the point $X(n 2), Y(n 3)$.

FIL $n^{--}$
This word fills the enclosed area just drawn with color value $n$. The ATARI BASIC FILI command is somewhat awkward to use. Careful reading of the ATARI BASIC Reference Manual is recommended.

G" --- ccec"
In Graphics Modes 1 or 2 this word performs the way the word ." does in text mode. The character string cccc will be compiled if in compiler mode or typed out if in interpreter mode. The POS word may be used to position the output.

SOUND
The sound command definition is practically identical to ATARI BASIC's SOUND definition. But another word not present in ATARI BASIC lets you alter the "filter" vaiues described in the HARDWARE MANUAL as AUDCTL. The word FILTER! sets this control register.

SOUND n1 n2 n3 n4 --
This word is used as: chan freq dist vol SOUND, $n 1$ is the channel number ( $0-3$ ); $n 2$ is the frequency, as described in the ATARI BASIC Reference Manual; $n \leqslant$ is the distortion control (an even number between 0 and 14); and $n 4$ is the volume ( $0-15$ ).

FILTER! n1 --
This word stores a value between 0 and 255 into audio control register AUDCTL. The default condition is 0 FIITER!, Using this control is not at all straightforward. Please refer to the HARDWARE MANUAL if you wish to alter the contents of this control register. Or, you can try a few different values and see what happens!

## DEBUG

## INTRODUCTION

Load the DEBUG package by typing:
21 LOAD
The package includes several very useful features for testing and debugging your FORTH programs.

Each function is described below, in standard FORTH terminology.

## DEFINITIONS

B? - -

This word types out the current EASE value (radix) without changing it. It overcomes an intrinsic difficulty in typing only BASE? , which always returns the value 10 no matter what the current radix is. ( 10 is the right answer, always.) This word types out the value Base 10, so that if your current base is hex, B? will type out 16.

CDUMP addr n -
This word types out $n$ bytes in character format, starting at addr, For example, to display the characters in any disk block, say, sector 34, type 34 BLOCK 128 CDUMP .

DUMP addr n ---
This word types out $n$ bytes in numerical format using the current value of BASE. You can go from a decimal dump to a hex dump by typing HEX first (and vice-versa).

## DECOMP cccc --

This word decompiles the previously entered, colon definition ccce for debugging purposes, Use this word cautiously, It is defined for the purpose of decompiling colon definitions only, and it can go off to never-never land if you try to decompile things like dictionary headers (e.g., FORTH), words terminated by ;CDDE or words whase definitions do not end in ; such as ABORT . Most non-colon definitions will cause the message " Primitive" to display if you try to decompile them. Try DECOMP VLIST and DECOMP © to see the different results.

## FREE

This word types out the number of free bytes of dictionary space left. NOTE that this number will vary depending on the current graphics mode.
H. $\mathrm{n}^{-}$

This word outputs the top of the stack in hexadecimal, no matter what the current value of BASE is. It is similar to $U$. (unsigned type-out).
S. --

This word prints out the contents of the stack in unsigned form using the current BASE (radix). It doesn't change the contents of the stack in any way. This is easily the most useful debugging tool. During program development you will probably use it very frequently.

The diskette copying routine supplied with this package is minimal, Load it into memory by typing

```
36 LOAD
```

To invoke the copy routine, type DISKCOPY and you will be prompted for what to do.
This routine requires 32 K of RAM to operate, and uses one drive to copy 90 sectors at a time. You may interrupt the copy routine by pushing the SYSTEM RESET key when you think it has copied enough sectors for your application. Or, you may copy single FORTH screens, two at a time, by using the LIST and MARK words as described in the introduction.

## EDITOR

## INTRODUCTION

The Editor in Extended fig-FORTH is the Screen Editor described in the Forth Interest Group's Installation Manual, complete and unchanged. It isn't the most sophisticated editor around, and it has some quirks that take getting used to. For example, it's difficult to insert spaces into a line of text. But the Editor is specifically designed to work with FORTH screens, and it's handy for that purpose.

To load the Editor into your system, put the Extended fig-FORTH diskette into drive 1 and type:

## 27 LOAD

Ignore any errors regarding duplicate names, To use the Editor, you must first type EDITOR to set the context to the Editor vocabulary. To edit a given screen, first type $n$ LIST to load the screen into memory.

One new word has been added to the Editor vocabulary: MARK. This word will mark every line in the current screen (the one you last used the LIST command with) as having been modified, so that when a subsequent FLUSH command is given, the whole screen will be written out. It is used primarily to update backup diskettes and to duplicate single screens onto other diskettes.

Whenever you've finished an editing session, type the word FLUSH to save your work. It is quite important to get into the habit of doing this. If you fail to do so, and subsequently your program bombs out, you can lose the last screen you edited.

## COMMANDS

## WORD FORM DOES

## L L

This word Lists the current screen. The current screen is changed by $n$ LIST which will list out screen $n$ and make it the current screen.
$T \quad \cap T$
This word Types out line $n$ and puts the cursor at the beginning of that line.
$E \quad n E$
This word Erases line n.
$D \quad \cap D$
This word Deletes line $n$ and moves up all following lines. Save the contents of the line in a buffer so that you can use an I command later, if desired,

P $\quad$ п $P$ ccce
This word Puts the character string cocc into line $n$ and erases the previous contents, if any, Use this command to create new lines. The string cccc may be any combination of characters and spaces up to 64 characters.

F F ecec
This word Finds character string cece in the current screen starting from the current cursor position.

This word extracts the character string ccce and shortens up the line. This is the primary find-and-delete command. The $X$ command uses the $F$ command, which means that the string search will commence from the current arsor position.

CLEAR
n CLEAR
This word CLEARs screen $n$ by completely filling it with blanks, It destroys any previous information on that screen. Note that an unused, unCLEARed screen will be filled with hearts, which is the ATARI null
character. CLEAR will replace the hearts with spaces,
COPY $n \mathrm{~m}$ COPY

This word COPYs screen $n$ onto screen $m$. It destroys any old information on screen $m$.

## MARK MARK

This word MARKs the qurrent screen as having been modified. A subsequent FLUSH command will cause the entire screen to be written out. Use it to copy a single screen to another diskette،

The best way to learn the Editor is to pick an arbitrary unused screen and use the IIST and CLEAR commands to erase it and make it the current screen. Then use the $P$ command to put several lines of text into the new screen. Then, try out the various commands, one at a time, until they become somewhat familiar. Use the command FLUSH if you want to keep the results of your work handy; otherwise, wse the command EMPTY-BUFFERS to erase all traces of your screen editing.

## INTRODUCTION

The floating-point package uses the ATARI floating-point routines in OS ROM, exactly as ATARI BASIC does. The routines aren't very fast, but they are easily accessible and fairly complete (there are no transcendental functions except LOG and EXP). Most of the floating-point word definitions follow the conventions for double-precision words as far as spelling goes, making them very easy to remember.

Before loading the floating-point package, first make sure that you have already loaded the ASSEMBLER. Then put in the master diskette and type:

60 LOAD
The floating-point routines will be loaded into the current dictionary,
All floating-point operations assume three-word variables (fn) with few exceptions. The only real variant from standard FORTH nomenclature occurs in the definition of floating-point constants and variables (FCONSTANT and FVARIABLE) in that these operations expect a floating-point number to be on the stack already. Therefore, the syntax is a bit different from single-precision or dauble-precision constants and variables.

A single-precision variable would, for example, be written:
1234 UARIAELE MYNUM
whereas a floating-point variable would be written:
FLOATING 1234 FUARIAELE MYNUM
To reduce typing, the word FLOATING has been given the synonym FP:
FF 1234 FUAFIAE:LE MYNUM
In fact, the word FLOATING or FP should precede any floating number if you wish that number to be placed on the stack in floating-point format.

You may enter floating-point numbers in any standard Fortran "E" format:

```
1.234
    .00000001
    -7.8945E-31
    9999999
    5
```

All the above numbers are legal floating-point numbers as long as they are preceeded by FP or FLOATING. The decimal point is optional for integer values. The package is easy to use. Here's an example of a square-root function definition:
: FSQRT FLOG FF 2.0 F/ FEXF ;
The routine expects a floating-point value on the top of the stack (top three words), takes the natural log of the value, enters the floating-point value 2.0 , divides the
numbers, and raises the result to the power "e". This is the standard "slow" square-root routine used in mathematics.

## DEFINITIONS

The following definitions conform to the standard FORTH nomenclature, with the addition of the symbol fn (e.g., f1, f2), which represents a three-word floating-point number.

FCONSTANT f1 --- cecc
The character string cccc will be a new word, which will place the floating-point constant $f 1$ on the stack. $f 1$ is normally preceeded by the word FLOATING or FP.

FVARIABLE fi ---- cect
The character string ccec will be a new word, which will return the address of the floating-point variable whose initial value will be f1, f1 is normally preceeded by the word FLOATING or FP.

FDUP f1 -m fi f1
This word duplicates the floating-point number on the top of the stack.
FDROP f1 f2 --- f1
this word drops the floating-point number on the top of the stack.
FSWAP f1 f2 -- f2 f1
this word reverses the order (swap) of the top two floating-point numbers on the stack.

FOVER f1 f2 --- f1 f2 f1
This word copies the second floating-point number and places it on the top of the stack.

FLOATING -- cecc --> fi
This word converts the character string cecc to a floating-point number and places it on the top of the stack. ccec must be in valid Fortran-style, floating-point number representation, such as, 1.23 or, 67 E 9 or $-9.876 \mathrm{E}-21$ or 5 . There is no error check. If the string ccce is invalid, the value of fi will be undetermined.

FP --- cecc --> fi
This is a synonym for FLOATING,
F@ addr --- fi
This word loads the floating-point number whose address is on the top of the stack.

```
F! f1 addr --
```

This word stores the floating-point number at the address on the top of the stack. A total of 4 words will be dropped from the stack at the completion of $F!$.
F. f1 $=$

This word types out the floating-point number on top of the stack. The output format will be identical to ATARI BASIC's output format. The floating-point number will then be dropped from the stack.

F? addr -

This word types out the floating-point number whose address is on top of the stack.
F+ f1 f2 $-\infty$ f
This word adds the top two floating-point numbers and places the result on the top of the stack.

F-f1 f2 $-\quad f 3$
This word subtracts the floating-point number f 2 from the floating-point number f 1 and places the result on the top of the stack.

F* f1 f2 $-f 3$
This word multiplies the top two floating-point numbers and places the result on the top of the stack.

F/ f1 f2 $-\infty 3$
This word divides the floating-point number f1 by the floating-point number f2 and places the result on the top of the stack.

FLOAT $\cap$ - fl

This word converts the integer on top of the stack is to a floating-point number and places the result on the top of the stack.

FIX fi - $\quad$ n
This word fixes the floating-point number on the top of the stack (after rounding) and places it on the top of the stack. The range of the integer result must be between -32768 and 32767.

FLOG f1 -- f2
This word replaces the floating-point number on the top of the stack with the number's natural logarithm.

This word replaces the floating-point number on the top of the stack with the number's log base 10.

FEXP f1 --f2

This word raises the floating-point number on the top of the stack to the power "e" and replaces the top of the stack.

FEXP10 f1 --- f2
This word raises the floating-point number on the top of the stack to the power 10 and replaces the top of the stack.
$F O=f 1-$ flag
This word drops the floating-point num ber from the stack and tests it. If the number is equal to zero, a true flag (1) is placed on the stack; otherwise, a false flag (0) is placed on the stack.
$F=f 1 f 2 — f l a g$
This word drops the top two floating-point numbers from the stack and compares them. If they're equal, a true flag (1) is placed on the stack; otherwise, a false flag $(0)$ is placed on the stack.
$F=<\quad$ f1 f2 $-\infty$ flag
This word drops the top two floating-point numbers from the stack and compares them. If f 1 is strictly less than f 2 , then a true (1) flag is placed on the stack; otherwise, a false (0) flag is placed on the stack.

## COMMENTS

This package isn't meant to be exhaustive, nor is any claim made for its level of usefulness. However, if you need floating-point capabilities, the package works quite well to extend the range of numbers, particularly in scientific calculations. Trignometric functions could be added by a clever programmer. A sufficient set is SIN, COS, and ATN. A random-number generator could also be added. In fact, any number of features could be added.

In summary, if you can't implement your program specifications using the double-precision capability of FORTH, then try this floating-point package.

## INTRODUCTION

This vocabulary package implements the full set of ATARI computer's OS I/O routines. It also adds a FORMAT command, as well as a BOOT850 command, which downloads the RS-232 I/O package into the system so that you may use the asynchronous I/O supplied in ROM in the ATARI 850 Interface Module (devices "R1", "R2", etc.).

Load the OS definitions package by typing:

$$
81 \text { LOAD }
$$

Load the BOOT850 package by typing:

$$
83 \text { LOAD }
$$

Be aware that the ATARI 850 I/O routines take up nearly 2 K of RAM, and they are loaded directly into the dictionary.

## DEFINITIONS

OPEN addr n1 n2 n3 --- n4
This word opens the device whose name is at addr on channel n1 with AUXI value n2 and AUX2 value n3. Upon return, it places the OS STATUS byte on top of the stack. The address of the name may be obtained by storing the character name in PAD and then referencing PAD in the OPEN command, EXAMPLE: ASCII 5 PAD C! will set the character " S " into the PAD buffer. Then, PAD 3120 OPEN will open " 5 :" on channel 3, with $A U X 1=12$ (read-and-write), and $A U X 2=0$.

CLOSE n1 --- n2
This word closes channel $n 1$ and returns the status byte at the top of the stack (n2). The status byte will always be a 1 (operation complete, no errors).

PUTC char n1 --n n2
This word outputs the character char on channel $n 1$ and returns status byte $n 2$.
GETC n1 --w char n2
This word gets one character from channel $n 1$ and returns it and the status byte n2.

GETREC addr n1 n2 --- n3
This word inputs record to address addr but no more than nl characters from channel n2. It returns status byte n3.

PUTREC addr n1 n2 --- n3
This word outputs ni characters from a buffer whose address is addr to channel
n2. It returns status byte n3.
STATUS n1 - n2
This word gets the status byte from channel ni.
DEVSTAT n1 -m n2 n3 n4
This word gets the device status bytes $n 2$ and $n 3$ and the normal status byte n4 from channel $n 1$.

SPECIAL n1 n2 n3 n4 n5 n6 n7 n8 --- n9
This command is the OS "Sperial" command that does anything any of the others can't. $n 1$ thru $n 6$ are the values of AOX1 thru AUX6, $n 7$ is the command byte (whatever your device wants), and $n 8$ is the channel number. The command returns the status byte n9.

## FORMAT

This word formats a diskette. The command is self-prompting.

## BOOT850

This word boots the Atari 850 Interface Module software drivers into the dictionary, Screen 83 must be loaded to execute this command. DO NOT TRY TO EXECUTE THIS COMMAND TWICE IN A ROW, THE SYSTEM WILL LOCK UP IF YOU DO.

## In order of technical level

## 1. Starting FORTH, Leo Brodie, Prentice-Hall

The best all-around book for anyone beginning programming...and not just in FORTH, This quite new book is everything one could want in a FORTH primer. It begins by assuming that you know absolutely nothing about computers at all and leads you to some quite sophisticated programs at the end. Even experienced programmers will learn a great deal from this fine work. HOWEVER, the text is not too compatible with fig-FORTH. There are many examples that will cause trouble when using fig-FORTH, Nevertheless...buy this book !! .... and read it !!!

## 2. Invitation to FORTH, Harry Katzan, Jr+, Petrocelli Books

This book is for the total novice, and deals primarily with introducing the first-time computer user to the fundamental concepts of computer programming, and explores FORTH somewhat casually as it moves along. Non-novice users will become impatient with the long elementary discussions and the awkward type-face (no descenders).

## 3. BYTE Magaxine, Vol. 5 No.e (Aug, 'B0)

The FORTH-dedicated issue which helped bring the concepts of FORTH to thousands of people who might not otherwise have ever heard of the language. While the presentations are somewhat erratic in their technical content, the whole issue deserves reading to acquire a taste for FORTH.
4. Dr Dobb's Journal, Vol.6 No.9 (Sept. '今1)

A second "dedicated issue" on the FORTH Language. This issue approaches FOiTH from quite a philosophical point of view, and is excellent reading for the somewhat advanced programmer who, say, already knows several languages. The issue is a wealth of ideas and solid FORTH programs .., the Ragsdale Assembler, for one!

## 5. A FQRTH PRIMER, W, Richard Stevens, Kitt Peak Mat'l Observatory

This is a "self-study" quide to FORTH from the place where it all started. The FORTH described differs somewhat from fig-FORTH, but the book is quite good. It includes some floating-point words which are not too different from the package included with this product.

## 6. Systems Guide to fig-FORTH, C. H. Ting, Offete Enterprises.

A complete, in-depth analysis of every fig-FORTH word used in the entire fig-FORTH vocabulary, If you ever wondered just exactly how a word such as 'TNTERPRET' works ... it's all here !! For the advanced FORTH programmer.
7. Threaded Interpretive Lanquages, R. G. Loeliger, McGraw-Hill

This is a definitive work for those who want to write their own FORTH Language processor. It uses 8060 code for its examples, but the routines are 50 well explained that it would be quite easy to translate the code to any other processor. The FORTH isn't exactly fig-FORTH, but the differences are quite minor, and are easily accomodated.
6. FQRTH Dimensions, the journal of the Forth Interest Group (fig) All Vols.

These bound journals are available from the Forth Interest Group, P.O. Eox 1105, San Carlos, CA 94070. The FORTH Language at its best and its worst. A highly-technical journal for the FORTH addict.

## STACK MANIPULATION

| DUP | $(n \rightarrow n n)$ | Duplicate top of stack. |
| :---: | :---: | :---: |
| CAOP | $(n-)$ | Throw away tod of stack. |
| SWAP | ( $n 1$ n2-n2 $n 1$ ) | Reverse top two stack items. |
| OVER | $(\mathrm{n} 1 \mathrm{n} 2 \rightarrow \mathrm{n} 1 \mathrm{n2}$ n1 ) | Make copy of second item on top. |
| ROT | $(\mathrm{n} 1 \mathrm{n2}$ n3 $\rightarrow$ n2 n3 n1 ) | Rotate third item to top. |
| -DUP | $(n-n ?$ ) | Duplicate onty if non-zero. |
| >R | $(n-1)$ | Move top item to "return stack" for temporary storage (use caution). |
| R> | $(-n)$ | Retrieve item from return stack. |
| R | $(-n)$ | Copy top of return steck onto stack. |

## NUMBER BASES

| DECIMAL | $(-\infty)$ |
| :--- | :--- |
| HEX | $(-)$ |
| GASE | $(-$ addr $;$ |

Sat decimal base.
BASE $\quad($ - addr ;

## Sat hexadecimal base.

Syster rariable containing number base.

## ARITHMETIC AND LOGICAL

| + | ( n1 n2 - sum ) | Add. |
| :---: | :---: | :---: |
| D+ | ( d1 d2 - sum) | Add double-precision numbers. |
| - | ( $\mathrm{n} 1 \mathrm{n} 2 \rightarrow$ diff) | Subtract ( $\mathrm{n} 1-\mathrm{n} 2$ ). |
| * | ( $n 1 n 2 \rightarrow$ prod) | Multiply. |
| / | ( $n 1 \mathrm{n2}$ - quot) | Divide ( $\mathrm{n} 1 / \mathrm{n} 2$ ). |
| MOD | ( $\mathrm{n} 1 \mathrm{n2} \rightarrow$ rem ) | Modulo (i.e. remainder from division). |
| /MOD | ( $n 1 n 2 \rightarrow$ rem quot ) | Divide, giving remainder and quotient. |
| -/MOD | ( $n 1$ n2 n3 - rem quot ) | Multiply, then divide ( n 1 *n2/n3), with double-precision intermediate. |
| -/ | ( n1 n2 n3 - quot ) | Like "/MOD, but give quotient only. |
| MAX | $(\mathrm{n} 1 \mathrm{n} 2 \rightarrow \max )$ | Maximum. |
| MIN | $(\mathrm{n} 1 \mathrm{n2}-\min )$ | Minimum. |
| ABS | ( $n \rightarrow$ absolute ) | Absolute value. |
| DABS | ( d - absolute ) | Absolute value of double-precision number. |
| MINUS | $(n-n)$ | Change sign. |
| DMINUS | $(d--d)$ | Change sign of double-precision number. |
| AND | ( $\mathrm{n} 1 \mathrm{n2} \rightarrow$ and $)$ | Logical AND (bitwise). |
| OR | ( $n 1 n 2 \rightarrow$ or ) | Logical OR (bitwise). |
| XOR | ( n 1 n 2 - xor) | Logical exclusive OR (bitwise). |

COMPARISON

| $<$ | $\left(\begin{array}{lll}n 1 & n 2 & -f\end{array}\right)$ |
| :--- | :--- |
| $>$ | $\left(\begin{array}{ll}n 1 & n 2 \\ n & f\end{array}\right)$ |
| 0 | $\left(\begin{array}{ll}n 1 & n 2 \\ n & f\end{array}\right)$ |
| $0=$ | $\left(\begin{array}{ll}n & -l\end{array}\right)$ |

True if $n 1$ less than $n 2$.
True if n 1 greater than n2.
True if too two numbers are equal.
True if top number negative.
True if toD number zero (i.e., reverses truth value).

## MEMORY

(addr }->\mathrm{ )
(n addr - )
(from to u - )
(addrub - )
(addr u - )
(addr u - )
```

Replace word address by contents.
Store second word at address on top.
Feten one byte only.
Store one byte only.
Print contents of address.
Add second number on stack to contents of address on too.
Move u bytes in memory.
Fill $u$ bytes in memory with $b$, beginning at address.
Fill u bytes in memory with zeroes, beginning at address.
Fill u bytes in memory with blanks. beginning at address.

## CONTROL STRUCTURES

| DO... LOOP | do: ( ond +1 start |
| :---: | :---: |
|  | ( - index ) |
| LEAVE | - ) |
| DO ... +LOOP | do: ( end +1 start $\rightarrow$ +1000: ( $n$ - ) |
| IF . . . (true) . . . ENDIF | if: ( 1 - |
| IF . . . (true) ... ELSE | it ( 1 - |
| BEGIN ... UNTIL | until: $19-$ |
| BEGIN ... WHILE | while: ( ${ }^{\text {f }}$ - |

Set up loop. given index range.
Place current index value on stack.
Terminate loop at next LOOP or +LOOP
Like DO . . LOOP, but adds stack value (instead of awwes '1') to index.
Y tod of stack true (non-zero), execute. [Note: Forth 78 uses IF . . THEN.] Same, but if faise, execute ELSE clause. (Note: Forth 78 uses IF . . . ELSE . . THEN.|

Loop back to BEGIN until true af UNTIL [Note: Forth 78 uses BEGIN . . . END.]
Loop while true at WHILE: REPEAT loops unconditionally to BEGIN.
[Note: Forth 78 uses BEGIN . . . IF . . AGAIN.]

TERMINAL INPUT-OUTPUT
$(n \rightarrow)$

| FORTH | $(-)$ |
| EDITOR | $(-)$ |
| ASSEMBLER | $(-)$ |
| DEFINITIONS | $(-)$ |
| VOCABULARY $\times \times x$ | $(-)$ |
| VLIST | $(-)$ |

Returns address of pointer to context vocabulary (searched first).
Peturns address of pointer to current vocabulary (where new definitions are put).
Main Forth vocabulary (execution of FORTH•sets CONTEXT vocabulary).
Editor vocabulary; sets CONTEXT.
Assembler vocabulary; sets CONTEXT.
Sets CURRENT vocabulary to CONTEXT
Create new vocabulary named $x \times x$
Print names of all words in CONTEXT vocabulary.
Print number.
Print number, right-justified in field.
Print double-precision number.
Print double-precision number, right-justified in fieid.
Do a carriage return.
Type one space.
Type $n$ spaces.
Print message (terminated by ").
Dump u words starting at address.
Type string of u characters starting at address.
Change length-byte string to TYPE form.
True if terminal break request present.
Read key, put ascii value on stack.
Type ascil value from stack.
Read $n$ characters (or until carriage return) from inout to address.
Read one word from input stream, using given character (usually blank) as detimiter.

Convert string at address to double-precision number.
Start output string.
Convert next digit of doubie-precision number and add character to output string. Convert all significant digits of double-precision number to output string. Insert sign of n into output string.
Terminate output string (ready for TYPE).
insert ascii character into output string.

List a disk screen.
Load disk screen (compile or execute).
Read disk block to memory address.
System constant giving disk block size in bytes.
System variable containing current block number
System variable containing current screen number.
Mark last buffer accessed as updated.
Write all updated buffers to disk.
Erase all butters.

Begin coion definition of $\times \times x$.
End colon definition.
Create a variable named $x x x$ with initial value $n$; returns address when executed.
Create a constant named $x \times x$ with value $n$; returns value when executed.
Begin definition of assembly-language primitive oderation named $x \times x$
Used to create a new defining word, with execution-time "code routine" for this data type in assembly
Used to create a new defining word. with execution-time routine for this data type in higher-level Forth.

Begin comment, terminated by right paren on same line; space atter (.
Forget all definitions back to and including $x \times x$.
Error termination of oderation.
Find the address of $x \times x$ in the dictionary; if used in detinition, compile address.
Returns address of next unused byte in the dictionary
Returns address of scratch area (usually 68 bytes beyond HERE).
System variable containing offset into input buffer; used, e.g., by WORD.
Returns address of top stack item.
Leave a gad of $n$ bytes in the dictionary.
Compile a number into the dictionary.

MISCELLANEOUS AND SYSTEM

Limited Warranty on Media and Hardware Accessories. Atari, Inc. ("Atari") warrants to the original consumer purchaser that the media on which APX Computer Programs are recorded and any hardware accessories sold by APX shall be free from defects in material or workmanship for a period of thirty (30) days from the date of purchase. If you discover such a defect within the 30-day period, call APX for a return authorization number, and then return the product to APX along with proof of purchase date. We will repair or replace the product at our option. If you ship an APX product for in-warranty service, we suggest you package it securely with the problem indicated in writing and insure it for value, as Atari assumes no liability for loss or damage incurred during shipment.

This warranty shall not apply if the APX product has been damaged by accident, unreasonable use, use with any non-ATARI products, unauthorized service, or by other causes unrelated to defective materials or workmanship.

Any applicable implied warranties, including warranties of merchantability and fitness for a particular purpose, are also limited to thirty (30) days from the date of purchase. Consequential or incidental damages resulting from a breach of any applicable express or implied warranties are hereby excluded.

The provisions of the foregoing warranty are valid in the U.S. only. This warranty gives you specific legal rights and you may also have other rights which vary from state to state. Some states do not allow limitations on how long an implied warranty lasts, and/or do not allow the exclusion of incidental or consequential damages, so the above limitations and exclusions may not apply to you.

Disclaimer of Warranty on APX Computer Programs. Most APX Computer Programs have been written by people not employed by Atari. The programs we select for APX offer something of value that we want to make available to ATARI Home Computer owners. In order to economically offer these programs to the widest number of people. APX Computer Programs are not rigorously tested by Atari and are sold on an "as is" basis without warranty of any kind. Any statements concerning the capabilities or utility of APX Computer Programs are not to be construed as express or implied warranties.

Atari shall have no liability or responsibility to the original consumer purchaser or any other person or entity with respect to any claim, loss, liability, or damage caused or alleged to be caused directly or indirectly by APX Computer Programs. This disclaimer includes, but is not limited to, any interruption of services, loss of business or anticipatory profits, and/or incidental or consequential damages resulting from the purchase, use, or operation of APX Computer Programs.

Some states do not allow the limitation or exclusion of implied warranties or of incidental or consequential damages, so the above limitations or exclusions concerning APX Computer Programs may not apply to you.

For the complete list of current APX programs, ask your ATARI retailer for the APX Product Catalog

\section*{Review Form}

We re interested in your experiences with APX programs and documentation, both favorable and unfavorable. Many of our authors are eager to improve their programs if they know what you want. And. of course. we want to know about any bugs that slipped by us. so that the author can fix them. We also want to know whether our
instructions are meeting your needs. You are our best source for suggesting improvements! Please help us by taking a moment to fill in this review sheet. Fold the sheet in thirds and seal it so that the address on the bottom of the back becomes the envelope front. Thank you for helping us!
1. Name and APX number of program.
2. If you have problems using the program, please describe them here.
3. What do you especially like about this program?
4. What do you think the program's weaknesses are?
5. How can the catalog description be more accurate or comprehensive?
6. On a scale of 1 to 10.1 being "poor" and 10 being "excellent". please rate the following aspects of this program:
```

    ____ Easy to use
    User-oriented (e.g.. menus. prompts. clear language)
    Enjoyable
    Self-instructive
    Useful (non-game programs)
    Imaginative graphics and sound
    ```
7. Describe any technical errors you found in the user instructions (please give page numbers).
8. What did you especially like about the user instructions?
9. What revisions or additions would improve these instructions?
10. On a scale of 1 to 10,1 representing "poor" and 10 representing "exceilent", how would you rate the user instructions and why?
11. Other comments about the program or user instructions:
